**DETAILED ACTION**

***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(a) the invention was known or used by others in this country, or patented or described in a printed publication in this or a foreign country, before the invention thereof by the applicant for a patent.

Claims 19, 23, and 24 are rejected under 35 U.S.C. 102(a) as being anticipated by Zagorskin et al.

The reference to Zagorskin teaches the basic structure of an aluminum oxide layer which is sandwiched between two aluminum layers. See, for example, the discussion at [0084]. With regard to claims 23 and 24, Zagorskin also teaches that the aluminum layers may be formed at thicknesses greater than 30 nm, thus inherently meeting these claim limitations. See the discussion at [0073].

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 20-22, and 25-27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zagorskin in view of applicant's admitted prior art on page 9 of the specification which incorporates IBM Technical Disclosure Bulletin, Vol.18, No. 8, January 1978, pgs. 2645, by reference. As taught in the IBM bulletin, it is also known in the art to form the device described in claim 23 by doping the aluminum layers with "paramagnetic impurities" or oxygen or nitrogen, as claimed. One would be motivated to combine this teaching with Zagorskin so as to lower the critical temperature of the superconducting conductors as described in the IBM bulletin.

Claims 28-30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Zagoskin in view of Kwon. Kwon also teaches the formation of a device similar to that described in claim 23, and further states that sandwich structures of aluminum/ aluminum oxide/ and either of Ti, Mo or niobium nitride are possible. See the discussion at [0065]. One would be motivated to combine this teaching with Zagoskin so as to achieve the advantages of the batch deposition and in-situ cleaning described by Kwon.
